Front cover: Representative pancreatic histopathology across experimental groups. Hematoxylin–eosin-stained pancreatic sections at 400× magnification showing normal control (A), negative control (B), positive control (C), miana 150 mg/kg (D), miana 200 mg/kg (E), and miana 250 mg/kg (F). The negative control group shows pronounced islet vacuolation and exocrine disruption, whereas the positive control and miana-treated groups demonstrate improved pancreatic tissue preservation, most notably at 250 mg/kg. L = islets of Langerhans; E = exocrine acinar cells. See "Handayani, T. W. ., Mariyani, M., Tandi, J., Caroline, C., & Magfirah, M. (2026). Antidiabetic Effects of Miana (Coleus atropurpureus) Leaf Ethanol Extract on Blood Glucose and Pancreatic-Renal Histopathology in Diabetic Rats.
